

# COMPUTER SHIELDING

## ROUTER GUARD

*If You Absolutely Must Use Wi-Fi*

We're not saying wi-fi is a good idea. But if there has to be a wi-fi router near the people you care about, whether at work, at school, or at home, then shield the darned thing. Router Guard is designed to dramatically reduce the radiation coming out of the router, while still allowing enough signal for connection. Just put the router inside the Router Guard shield. All metal mesh allows plenty of cooling air circulation. Of course, with the weaker signal, you won't get the same reach... which means you might even prevent your neighbors from mooching off your network. And by the way, if you are bothered by a multitude of neighbors' signals, you can offer them a Router Guard to put on *their* routers! Holds 12 x 8.75 x 2.75 inches. Remember that your laptop also emits the wi-fi microwave signal. Consider shielding the laptop as well! **Router Guard (Cat. #R249) ..... \$52.95**

## SIGNAL TAMER™

*Shielding Pouch for Routers Reduces Radiation Emission*

Raise your hand if you ever wondered: "How much microwave radiation is my wi-fi router pumping out?" I can assure you it is a lot more than you need. You know this is true because you can pick up the router signal from your neighbors who can be several houses away! Routers are notoriously overpowered. In most homes you can get away with 1/10<sup>th</sup> or even 1/100<sup>th</sup> of the power they provide. So why irradiate yourself and your family with all that extra (and unnecessary) microwave energy?

**Signal Tamer** is such a simple way to soften the signal, just enough so that it **reduces radiation output by 90-95%**, but still allows the router to function without losing speed. Special shielding fabric mesh pouch allows plenty of air flow and very easily slips over the entire router. Installs in seconds. No need to disconnect your router or interrupt service. Reduces range by about half, so it will be harder for your neighbors to get your signal. If you sit next to a wi-fi router at home or at work, or if you have one in your bedroom, or if you have children in the house, you owe it to yourself to get one and muzzle that menace today. Signal Tamer is adjustable. If you need a bit *less* shielding performance, just allow a small opening at the base. By varying the size of the opening, you can adjust the amount of signal "leakage". 10x16 inches. **Signal Tamer™ (Cat. #R220) ..... \$34.95**

## SIGNAL TAMER™ XL *Larger Version for Larger Routers*

Need a super sized version? This extra large Signal Tamer is about the size of a standard pillow case (~20x24 inch) and can cover larger routers, laptops, and other RF emitting devices. **Signal Tamer™ XL (Cat. #R220-XL) ..... \$49.95**

## RadiaFence™

*Create A Radiation Shadow Where You Need It*

So what do you do when you need a wireless radiation emitting device but you want to limit the exposure to the people? RadiaFence is the answer. It's a free-standing, semi-transparent microwave barrier that you can put almost anywhere you need. It blocks most of the radiation emitted in one direction by "casting a shadow" (typically 70-90% reduction), while still allowing the wireless device to work. Like sitting in shade on a sunny day. See page 97 for full details.
